

## Challenge: Linked list with inconsistent data

In class, you learned how to make a linked list. But the problem we are facing is that in the linked list that you have learned to implement, all the data in the list are of the same type. But we would like to implement a linked list that can store inconsistent data. For example, store int in one node, string in another node, and float in another node.

Upload your idea for this problem along with the suggested code sample in the form of a PDF file.
