In this question should be with this file work In this file, several records of the following structure type are written in binary form:

```
1    struct input {
2        int id;
3        char name[10];
4    };
```

By giving a number n to the program, we want to read the n-th record in this file and print the corresponding ID and name of that record as follows:

```
id:name
```

Use fseek to find the location of the desired record, then use the fread function to perform the reading operation.
